

● worst fold (test domain) ○ mean over surviving folds — ERM final seed 0, worst domain

Tuning runs (seed 0), test AUROC at the ID-val-selected checkpoint; diverged runs excluded ('k div.': k folds diverged; 'all k div.': no fold survived). Tick labels: hyperparameter value(s) and [number of folds whose ID-val AUROC chose it].

Method grids ran at each fold's own selected lr (top row); every fold contributes its own slice.
